

1 CLAIMS

2 What is claimed is:

3 1. A method of implementing a cellular automata based random number
4 generator (CA-based RNG), comprising:

5 determining an interconnection topology;

6 screening a CA-based RNG candidate based on said interconnection topology;

7 and

8 subjecting said CA-based RNG candidate to a suite of random number tests in
9 response to said CA-based RNG passing said screening step.

10

11 2. The method of claim 1, wherein said CA-based RNG candidate is
12 under a periodic boundary condition in at least one dimension.

13

14 3. The method of claim 1, wherein said interconnection topology is
15 identical for all cells of said CA-based RNG candidate.

16

17 4. The method of claim 1, wherein said determining topology (310) step
18 includes:

19 exhaustively providing all possible interconnection topologies for a given
20 neighborhood number for cells of said CA-based RNG candidate.

21

1 5. The method of claim 4, wherein said determining topology (310) step
2 further includes:

3 pruning said interconnection topologies to reject interconnection topologies
4 for which no input of a cell of said CA-based RNG candidate is connected to said
5 cell's output.

6

7 6. The method of claim 4, wherein said determining topology (310) step
8 further includes:

9 pruning said interconnection topologies to reject interconnection topologies
10 for which displacement values for all inputs for a cell are evenly divisible by a length
11 of said CA-based RNG for any displacement values whose absolute value is greater
12 than 1.

13

14 7. The method of claim 1, wherein said screening (320) step includes:
15 calculating entropy of said CA-based RNG candidate; and
16 accepting said CA-based RNG candidate for testing based on one or more
17 predetermined criteria.

18

19 8. The method of claim 7, wherein said calculating entropy step includes:
20 calculating an expected value of a subsequence within a sequence;
21 initializing said CA-based RNG candidate through a predetermined number of
22 clock cycles and monitoring occurrences of said subsequence; and

23 determining said entropy based on said expected value and results of
24 monitoring said subsequence occurrences.

25

1 9. The method of claim 8, further comprising:
2 rejecting said CA-based RNG in response said occurrence being greater than a
3 multiple of said expected value.

4
5 10. The method of claim 7, wherein said accepting step includes accepting
6 said CA-based RNG candidate for testing in response to said CA-based RNG
7 candidate being in a list of a predetermined number of highest entropy CA-based
8 RNG candidates.

9
10 11. The method of claim 10, wherein said accepting step includes
11 accepting said CA-based RNG candidate for testing in response to said entropy of
12 said CA-based RNG candidate being at or above a predetermined threshold entropy.

13
14 12. The method of claim 1, wherein said standardized suite of random
15 number tests includes the DIEHARD suite of tests.

16
17 13. The method of claim 1, further comprising:
18 selecting said CA-based RNG candidate in response to said CA-based RNG
19 candidate passing said suite of random number tests without at least one of time
20 spacing and site spacing.

21
22 14. A cellular automata based random number generator (CA-based RNG)
23 implementing-module, comprising:

24 an interconnection-topology-determining-module determining an
25 interconnection topology;

1 a screening-module screening a CA-based RNG candidate based on said
2 interconnection topology; and

3 a testing-module subjecting said CA-based RNG candidate through a suite of
4 tests in response to said CA-based RNG passing through said screening-module.

5

6 15. The CA-based RNG implementing-module of claim 13, wherein said
7 screening-module comprises:

8 an entropy-calculating-module calculating entropy of said CA-based RNG
9 candidate; and

10 a sorting-module accepting or rejecting said CA-based RNG candidate for
11 testing based on a predetermined criteria.

12

13 16. The CA-based RNG implementing-module of claim 15, wherein said
14 entropy-calculating-module comprises:

15 an expected-value-module calculating an expected count value of
16 subsequences within a sequence;

17 an accumulating-module accumulating actual counts of said subsequences;
18 and

19 an entropy-determining-module determining said entropy based on an output
20 or outputs of said accumulating-module;

21

22 17. The CA-based RNG implementing-module of claim 15, wherein said
23 sorting-module accepts said CA-based RNG candidate for testing in response to said
24 CA-based RNG candidate being in a list of a predetermined number of highest
25 entropy CA-based RNG candidates.

1

2 18. The CA-based RNG implementing-module of claim 15, wherein said
3 sorting-module accepts said CA-based RNG candidate for testing in response to said
4 entropy of said CA-based RNG candidate being at or above a predetermined threshold
5 entropy.

6

7 19. The CA-based RNG implementing-module of claim 14, wherein said
8 interconnection-topology-determining-module comprises:

9 a topology-generation-module generating one or more interconnection
10 topologies; and

11 a topology-pruning-module pruning said interconnections based on one or
12 more predetermined criteria.

13

14 20. The CA-based RNG implementing-module of claim 19, wherein said
15 topology-generation-module exhaustively provides all possible interconnection
16 topologies for a given neighborhood number for cells of said CA-based RNG
17 candidate.

18

19 21. The CA-based RNG implementing-module of claim 19, topology-
20 pruning-module prunes said interconnection topologies to reject interconnection
21 topologies for which no input of a cell of said CA-based RNG candidate is connected
22 to said cell's output.

23

24 22. The CA-based RNG implementing-module of claim 19, topology-
25 pruning-module prunes said interconnection topologies to reject interconnection
